2007 Anchorage Community Survey Executive Summary

Methodology

The *Anchorage Community Survey 2007* is the second in our series of biannual surveys of the Anchorage municipality. The goal of the surveys is to build a longitudinal data source for public opinions about life in Anchorage neighborhoods, perceptions of local services, and reports of community interactions. The survey design utilized the Tailored Design Method (Dillman 2007). The Justice Center initially contacted 3,780 potential respondents, with 60 respondents randomly selected for inclusion from 43 of the census tracts in the Municipality of Anchorage and 100 respondents randomly selected for inclusion from the remaining 12 census tracts in the Municipality of Anchorage. These are census tracts that have had historically low response rates. The twelve census tracts that were over-sampled were located in Airport Heights, Fairview, Mountain View, Northeast, Russian Jack Park, South Addition, Spenard, and Tudor Area. Some census tracts span more than one community council and some community councils contain more than one census tract. The UAA Justice Center received 1,772 questionnaires by mail or online, achieving a 55.3 percent response rate overall.

All of the results presented in this document are the unweighted figures compiled from survey returns. No statistical adjustments have been made for race, gender, income, age, or area oversampling. Sample weighting is important when groups who are represented at disproportionate levels in our sample have different attitudes about life in Anchorage neighborhoods, the quality of local services, or the content of their community interactions. Nonetheless, unweighted data can be used with confidence if one compares samples that had different probabilities of selection rather than considering them as unified parts of a single sample. Because the sampling design allowed unequal probabilities of selection by community area, the area-specific results can be quite useful. These are presented in the Anchorage Community Survey 2007 Sourcebook online through the Community Indicators Project at <http://justice.uaa.alaska.edu/indicators/ACI/index.html>. Readers should be cautious in interpreting the results presented here and should consider the characteristics of respondents in our sample. Percentages reported in this executive summary are always based on the total number of respondents (N = 1,772), regardless of how many valid answers were provided.

Respondent Demographic Information

More women than men responded to this survey (59% female, 39% male, with 47 individuals declining to specify their sex), despite comparable numbers of men and women selected into the sample. The average age of respondents was 48 years. Over half of the respondents were married (59%) and 79 percent had some education beyond high school (28% had completed some college credits, 11% had an Associate's degree, 26% had a Bachelor's degree, and 15% had a graduate

degree). Over half of the respondents (61%) also had a household income of \$50,000 or more. Most respondents were employed full-time (65%) or retired (13%). Over half (58%) of respondents lived in one-person or two-person households, and 63 percent had no children living in the home. Of those with children, most had fewer than two children attending schools in the Anchorage School District. Respondents exhibited long residential tenure in Anchorage, with 59 percent having lived here more than 15 years and 37 percent having lived here for more than 25 years. Seventy-six percent of respondents owned their own home and 61 percent did not expect to leave Anchorage in the foreseeable future.

Part 1. Life in Anchorage Neighborhoods

Residents throughout the Municipality of Anchorage generally liked their neighborhood and generally reported a strong sense of community with their neighbors. The overwhelming majority of respondents (91%) liked or strongly liked their neighborhood as a place to live. In addition, 82 percent of respondents agreed or strongly agreed that their neighborhood is an excellent place to live. Respondents also reported that their neighbors can be trusted, they get along with each other, they share the same values, and they are willing to help one another. However, only 43 percent reported that their neighborhood is close-knit. Most respondents indicated that neighbors could be counted on to intervene in cases of juvenile delinquency and youth misbehavior, such as graffiti spray-painting (though truancy seems less likely to produce that intervention than other forms of delinquency), and to intervene if there were a fight in front of their own house. Respondents also indicated that neighbors would mobilize if their local fire station were threatened with budget cuts. However, average scores on these items were somewhat lower this year than they were in 2005, indicating that respondents believed their neighbors were now somewhat less likely to intervene in neighborhood problems.

Thirty-six percent of respondents indicated that racism had been a problem in Anchorage in the past year, and 27 percent said that they had personally experienced racism in the past year. Respondents most commonly reported racism while they were shopping and while they were at work (12% and 11%, respectively). Only five percent of total respondents said that they had experienced racism from police, and three percent reported racism from the justice system.

Nearly 26 percent of respondents reported that a burglary, robbery, or mugging had occurred in their neighborhood in the past six months and nearly 16 percent reported that a violent argument between neighbors had occurred during that same time. Forms of neighborhood physical disorder (e.g., poor conditions of buildings, cars, lots, lighting) and neighborhood social disorder (e.g., public drinking/drug use, prostitution, graffiti, homeless sleeping in the neighborhood) were not commonly reported by Anchorage residents. However, almost 25 percent of residents reported forms of physical disorder: abandoned cars or buildings, poor lighting in the neighborhood, and the presence of overgrown shrubs and trees. A range of 7 to 16 percent of respondents indicated that there were forms of social disorder present in their neighborhoods.

Most residents had little or no fear of crime in their neighborhoods, and fear of crime rarely prevented participation in normal activities in the neighborhood. However, 16 percent of respondents did find that fear of crime limited their activities, while 18 percent reported a moderate or great amount of fear that they or members of their households would be burglarized while in the home. Eight percent of respondents indicated that they had been violently victimized in their present neighborhood. Ninety-six percent of residents said that they take some kind of precaution against crime in their

homes (e.g., locking doors, using a home security system, belonging to neighborhood watch, taking self-defense lessons), and 46 percent stated that they keep a firearm for protection against crime.

Part 2. Social Activities and Organizations

Sixty-two percent of survey respondents indicated that they belong to one or more local organizations, with most belonging to a religious organization like a church, synagogue, or mosque. Still, respondents in the 2007 survey reported less involvement in every type of social organization than those in the 2005 survey. Most visited frequently with their neighbors, knew a good number of them, and reported that they had friends and relatives in the neighborhood. Forty-four percent of residents had lived in their current home for five years or less, while 23 percent had been in the same home for more than fifteen years.

Fifty-seven percent of residents had donated their time without pay to charitable, religious, civic, or other volunteer organizations in the past year. Of these volunteers, most donated ten hours or fewer per month. Twenty-one percent of respondents donated their time to programs that benefit neighborhood youth and about 10 percent provided their time for organizations devoted to justice issues.

The biggest public safety issues identified by respondents were, in order of frequency, (1) poor lighting in their neighborhoods, (2) traffic safety concerns about speeding, lack of sidewalks, and children playing in the street, and (3) crime, ranging from property crimes to physical and sexual assaults. A smaller number of people voiced concern about wildlife in the neighborhood, feeling unsafe in city parks and green spaces, and the threat posed both to and from unsupervised children (i.e., that kids may be run over while playing in the street or may fill their adult-free hours with vandalism and minor criminal activity). Most requests for change asked that these problems be eliminated, but concrete ideas for how this might be accomplished were rarely offered. Respondents most often cited the need for better community interaction with their neighbors, better police intervention in their neighborhood through improved visibility and enforcement of the law, and more city-maintained lighting. Many also said that the removal of specific residential or commercial neighbors would vastly improve their neighborhoods. Others campaigned for public space allotment for parks and recreational areas and wished for improved housing conditions (i.e., for owners to maintain their properties with necessary repairs and residential niceties like flowers and landscaped yards).

Part 3. Local Services

Municipality of Anchorage residents generally reported being satisfied with the services provided in their neighborhoods and services provided throughout the Municipality. Respondents were most satisfied with the quality of their garbage collection, fire services, and emergency medical services. The lowest satisfaction rankings were assigned to the People Mover bus system, neighborhood recreational facilities, and street maintenance (but all of these services were still rated above average). Just nine percent of respondents indicated that they (or members of their close circle of family and friends) had used Anchorage fire services, 20 percent had used emergency medical services, and 28 percent had used the People Mover. Ratings of all services were lower in the current survey than they were two years ago, although this may be an artifact of how the question and response choices were presented.

Generally, residents rated the public service provided by Municipal business offices and employees as average or slightly below average. The highest rating was for employment of polite and professional staff. The Municipality garnered the lowest ratings for the perceived willingness to address problems identified by residents and the distribution of information to residents. Only approximately one-third of respondents reported that they interacted with staff members at the Municipality of Anchorage, suggesting that attitudes toward the Municipality may be influenced by news reports or personal perspectives as well as by contact with staff.

Sixty-six percent of respondents rated the quality of health and medical care services available in Anchorage as good or excellent, but 30 percent rated these services as either fair or poor. Eighty-five percent of those who participated in our survey had access to public or private health insurance, but 14 percent lacked any medical coverage (up from 11 percent two years ago). More than half of respondents sought medical care for themselves and family members more than three times during the past year while 11 percent received no medical care at all. The overwhelming majority of respondents (78%) indicated that they had required medical attention over the course of the previous year, and almost all of these individuals reported that they were able to obtain the care that they needed (75% of the total sample). Seven percent of respondents indicated that although they had needed medical care, they were unable to get it because of several factors: cost, the barrier presented by a lack of health insurance, or the lack of a required medical specialty in Alaska. Most Anchorage residents usually went to a private doctor's office for treatment, but 25 percent of respondents said that they usually went to the emergency department for care, while 12 percent said they ordinarily rely on a hospital for their care. Only 13 percent reported primarily using urgent care clinics meant to divert non-emergency cases away from hospital emergency departments.

The concept of community justice centers was not well understood by Anchorage residents. After a one-sentence descriptor of such centers, nearly half of respondents were unsure whether they would be interested in having one located in their neighborhood. Twenty-seven percent of our sample expressed an interest in having a community justice center located nearby, while 23 percent opposed its location in their area. While 42 percent of respondents were decidedly uninterested in volunteering their time at a neighborhood community justice center, 18 percent voiced an interest and another 38 percent were willing to entertain the possibility of volunteering at a local center.

Anchorage residents provided a generally positive view of police on a range of questions, as they did in the 2005 survey. Most stated that Anchorage police were responsive to local issues (65%), did a good job of responding to problems in the neighborhood (55%), and maintained order on the streets (61%). Fifty percent of Anchorage respondents also believed that police were preventing neighborhood crime, up from 42 percent in 2005, and that police responded well to residents after they had been victims of crime (47%). Despite over 50 percent of all respondents reporting that they or someone in their close circle of friends and family had some type of contact with the police in the last year, a range of 16 to 34 percent of respondents indicated that they had no opinion about the work police were doing. It may be that those who have had no direct or indirect contact with police feel unable to form an opinion, despite information they may receive from news reports or other sources.

The complete sourcebook for the 2005 survey and data set is available online at <http://justice.uaa.alaska.edu/research/2000/0508anchsurvey/0508sourcebook.html>. More detailed results from the 2007 survey, such as area-specific results, will be made available on the Community Indicators Project at UAA website, at <http://justice.uaa.alaska.edu/indicators/anchorage/sourcebook/2007/index.html>.

Respondent Demographic Characteristics

Table D.01. Respondent's Age: Summary

Question 29. How old were you on your last birthday?

Response	Frequency	%	Cumulative %
Under 25	68	3.8 %	3.8 %
25–34 years old	248	14.0	17.8
